1 Version history

Version 1,2020-09-13

• Validation of combined models version 09, from start of mission until 2020-06-30.

2 Introduction

We report some statistics of the individual and combined GFMs produced on the context of the *Multi-approach gravity field models from Swarm GPS data* project. The approach for combining individual gravity field solutions, i.e. those produced by the various partners mentioned in Section 3, is described in Section 4.1. The procedure and assumption used to derive the statistics is described in Section 4.2. Finally, the results are presented in Section 5.

This report does not intend to draw conclusions regarding the presented statistics, it is merely a descriptive document of the signal and error in the individual and combined Swarm GFMs. For this reason, the text in Section 5 is restricted to clarifying the quantities shown in the plots.

3 Source data

The individual gravity field solutions are produced by the institutes listed in Table 1.

Table 1 – Overview of the gravity field estimation approaches

	Inst.	Approach	Reference
	AIUB	Celestial Mechanics Approach (Beutler et al., 2010)	Jäggi et al. (2016)
	ASU	Decorrelated Acceleration Approach (Bezděk et al., 2014;	Bezděk et al.
	ASU	Bezděk et al., 2016)	(2016)
	IfG	Short-Arcs Approach (Mayer-Gürr, 2006)	Zehentner and
	IIG	Short-Aics Approach (Mayer-Guit, 2000)	Mayer-Gürr (2016)
	OSU	Improved Energy Balance Approach (Shang et al., 2015)	Guo et al. (2015)

Additional details about the different gravity field approaches can be found in (Teixeira da Encarnação and Visser, 2017).

The version of the individual GFMs is listed in Table 2.

The version numbers listed in Table 2 are relevant within the project and are reported so that it is possible to trace back the results presented in Section 5. Particular to the combined models, version 09 relates to the chosen combination strategy, as concluded from Teixeira da Encarnação and Visser (2019).

Gravity Field Model	version	Kinematic Orbit
AIUB	01	AIUB
ASU	02	IfG
IfG	03 - 06	IfG
OSU	02	AIUB
combined	09	N/A

Table 2 – Versions of the GFMs, and the KOs used in their estimation, relevant to this report.

4 Methodology

4.1 Combination

The combination of the models is conducted at the level of the solutions considering weights derived from Variance Component Estimation (VCE). As demonstrated in Teixeira da Encarnação and Visser (2019), the combination at the level of Normal Equation (NEQ) disagreed more with GRACE/GRACE-FO, as a result of the vastly different amplitudes of formal errors.

The combination considers the complete degree range (degrees 2 to 40) but the VCE weights are derived from degrees 2-20. This approach addresses the very high errors above degree 20, which would otherwise drive the value of the weights.

It is feasible to determine the VCE weights because there are two time-series based on AIUB orbits (i.e. AIUB and OSU) and two time-series based on IfG orbits (i.e. IfG and ASU). Therefore the impact of the KOs on the solutions and on the VCE weights is balanced.

4.2 Validation

The validation is done by comparing the individual and combined solutions to a model estimated from the Release 6 (RL06) GRACE/GRACE-FO GFMs produced at Center for Space Research (CSR), considering all solutions available at the this document is produced. This models fits a degree 1 polynomial and a yearly, semi-yearly, S2, K1 and K2 periods to the GRACE/GRACE-FO time series; the time series produced on the basis of the parameters resulting from this regression are referred to as *GRACE/GRACE-FO climatological model*.

The $C_{2,0}$ coefficient in all solutions has been replaced by the weekly time series provided by Goddard Space Flight Center (GSFC) (Loomis, Rachlin and Luthcke, 2019).

All solutions undergo a 750km radius spherical cap Gaussian filtering, unless otherwise noted, to clearly show the geophysical signal contained in the Swarm solutions. The GRACE and GOCE Gravity Model 05 (GGM05G) (Bettadpur et al., 2015) static GFM is subtracted from all models in order to isolate the time-variable component of Earth's gravity field. We chose to show the gravity field in terms of EWH, except for the statistics related to the correlation coefficient, which are non-dimensional as usual. The GRACE/GRACE-FO gravity field time series is linearly interpolated to the mid-month epoch of the Swarm solutions. The GRACE/GRACE-FO climatological model is evaluated at the same time domain. The analysis spans the complete Swarm mission period until 2020-06-30.

Some analyses are restricted to either the land or ocean areas. In those cases, the land or ocean mask is applied in the spatial domain and a Spherical Harmonic (SH) analysis is done on the masked grid. The ocean mask excludes the coastal ocean areas that are roughly 1000km or less from land areas, as shown in Figure 2, while the land mask has no buffer zone.

In Section 5.3, the geophysical signal represented by the Swarm solutions is evaluated on the basis of the time series of average EWH over restricted geographical locations, shown in Figure 3.

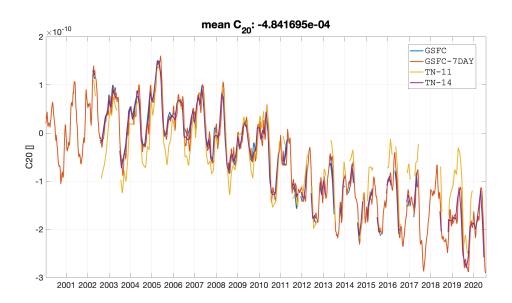

Figure 1 – Monthly (GSFC) and weekly (GSFC-7DAY) versions of the time series of SLR-derived C_{20} from Loomis, Rachlin and Luthcke (2019), compared to Cheng and Ries (2018) (TN-11) and Loomis and Rachlin (2020) (TN-14).

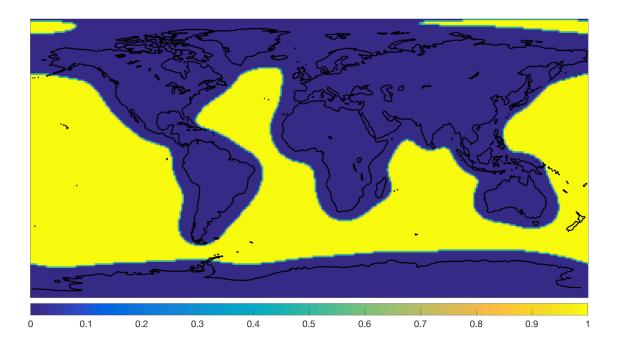

Figure 2 – Deep ocean mask.

Each averaging is done over the corresponding spatial truncation of an equiangular grid representation of the SH coefficients. The locations shown in Sections 5.3.1 to 5.3.18 are related to the largest hydrological basins and polar regions with the highest signal variability observed by GRACE/GRACE-FO. Note that there is no effort to meticulously consider or implement proper leakage reduction methods, e.g. by Guo, Duan and Shum (2010). We perform a parametric regression on all time series considering a constant and drift terms,

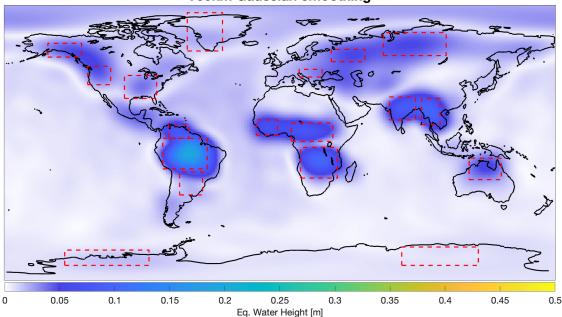

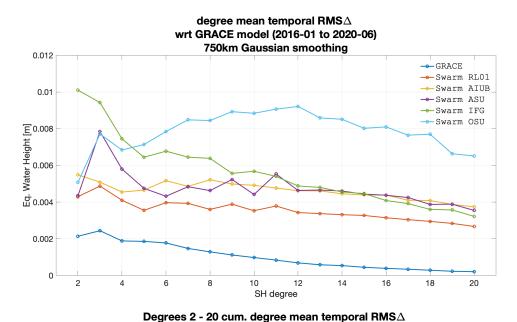

Figure 3 – Temporal variability of the GRACE/GRACE-FO climatological model, including the boundaries of the regions analysed in Section 5.3.1 to Section 5.3.18.

along with annual and semi-annual sine and co-sine terms to improve the robustness. We plot the linear part of this regression, in order to quantify the accuracy of Swarm-derived climatological trends. The time series are plotted along with tables presenting some statistics. The values of the constant and linear terms for the Swarm and GRACE/GRACE-FO solutions (column 1) are show in terms of EWH (columns 2 and 4). Additionally, the difference of these parameters between the Swarm and GRACE/GRACE-FO solutions relative to the GRACE/GRACE-FO climatological model is listed in columns 3 and 5 (the values for the latter data set in these columns is zero). Finally, the correlation coefficients is presented in the last column (the value for GRACE/GRACE-FO climatological model is 1). The constant term is the average basin storage over the relevant data period.

Results 5

Spatial analysis 5.1

5.1.1 Degree-mean RMS difference

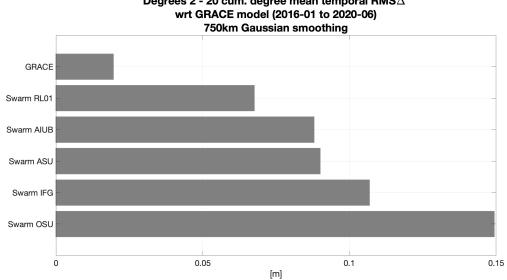

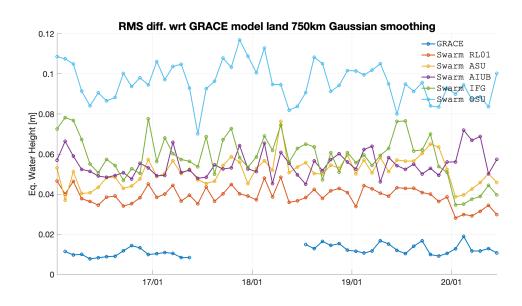

Figure 4 - Per-degree mean of the RMS difference (top) and cumulative degree-mean temporal RMS difference (bottom) between the Swarm GFMs and GRACE-based prediction, considering 750km Gaussian smoothing. This is (an estimate of) the average per-degree quality of the various Swarm solutions in the spectral domain (top) and globally (bottom) . The degree amplitudes remain relatively constant with increasing degree, instead of growing in terms of EWH, as the result of the smoothing.

5.1.2 Cumulative degree amplitude difference over land

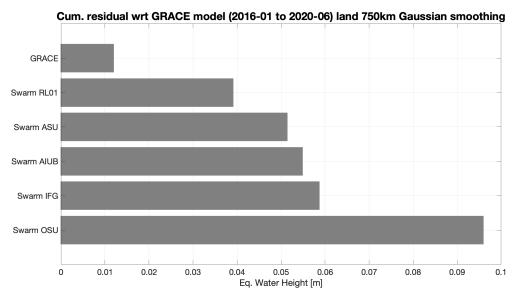

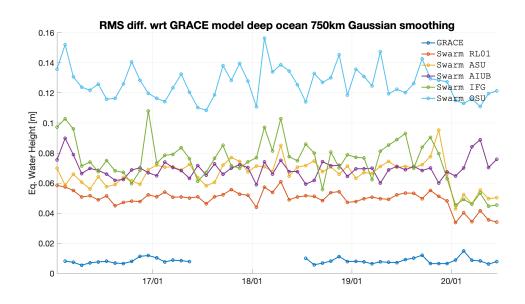

Figure 5 – Epoch-wise cumulative spatial RMS (top) and its global average (bottom) of the difference between Swarm GFMs and GRACE-based prediction, over land areas, considering 750km Gaussian smoothing. This is (an estimate of) the evolution of the ability of the various Swarm solutions to predict land mass transport processes over time (top) and its global sum (bottom).

5.1.3 Cumulative degree amplitude difference over oceans

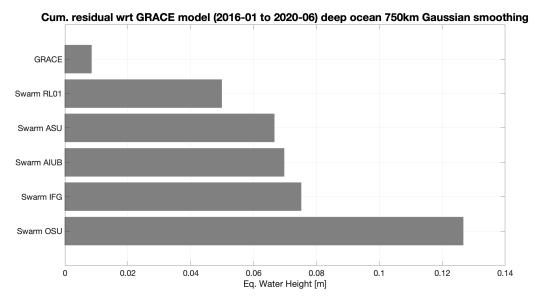

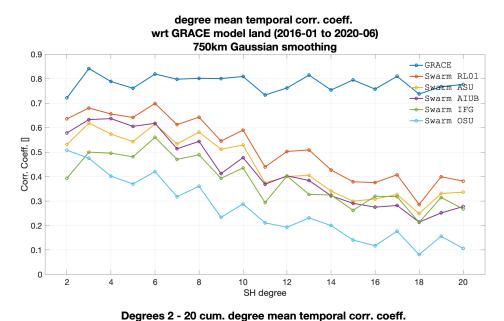

Figure 6 – Epoch-wise cumulative spatial RMS (top) and its global sum (bottom) of the difference between Swarm GFMs and GRACE-based prediction, over ocean areas, considering 750km Gaussian smoothing. This is the epoch-wise quality of the Swarm GFMs, and reported in the header of the combined GFMs files.

5.2 Temporal analysis

5.2.1 Cumulative degree amplitude difference over land

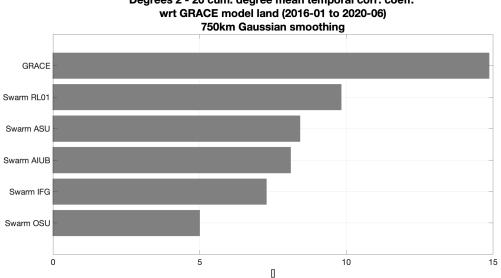

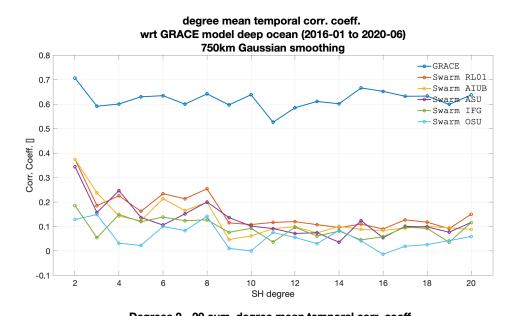

Figure 7 – Per-degree mean (top) and its overall cumulative (bottom) of the correlation coefficient between Swarm GFMs and GRACE-based prediction, over land areas, considering 750km Gaussian smoothing. The temporal correlation at every Stokes coefficient is computed and the average over each degree is plotted at the top. It illustrates how well the temporal variations of the Swarm models agree with what is predicted from the GRACE/GRACE-FO climatological model.

5.2.2 Cumulative degree amplitude difference over oceans

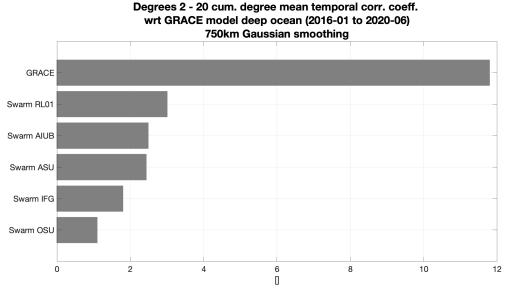

Figure 8 – Per-degree mean (top) and its overall cumulative (bottom) of the correlation coefficient between Swarm GFMs and GRACE-based prediction, over ocean areas, considering 750km Gaussian smoothing. It illustrates that the Swarm models agree poorly with the mass variations over the ocean as predicted by the GRACE/GRACE-FO climatological model.

5.2.3 Triangular plots of the RMS differences

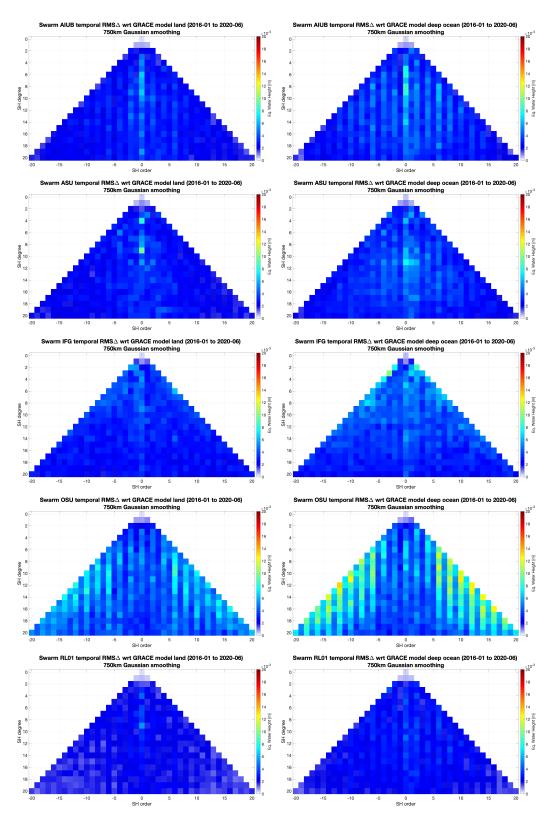

Figure 9 – Per-coefficient RMS difference between Swarm GFMs and GRACE-based prediction considering 750km Gaussian smoothing, over land (left column) and ocean (right column) areas, for AIUB, ASU, IfG, OSU and combined solutions (respectively from top to bottom).

5.3 Time series of storage catchments

Table 17 – Statistics of the agreement between GRACE/GRACE-FO and Swarm time series relative to the GRACE/GRACE-FO climatological model for the Indochina region.

5.3.16 Northern Australia region

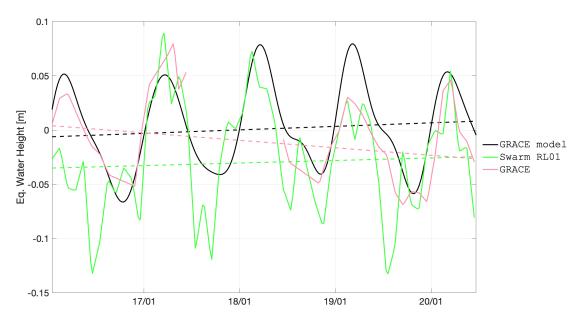

Figure 25 – Time series of EWH for the Northern Australia region (latitude -24 to -10 degrees, longitude 124 to 145 degrees).

solution	constant	constant	linear term	linear term	corr. coeff.
Solution	term [cm]	term Δ [cm]	[cm/year]	Δ [cm/year]	[]
GRACE MODEL	0.46	0.00	0.32	0.00	1.00
Swarm RL01	-2.66	-3.12	0.23	-0.09	0.66
GRACE	-0.49	-0.95	-0.69	-1.01	0.85

Table 18 – Statistics of the agreement between GRACE/GRACE-FO and Swarm time series relative to the GRACE/GRACE-FO climatological model for the Northern Australia region.

5.3.17 Western Antarctica region

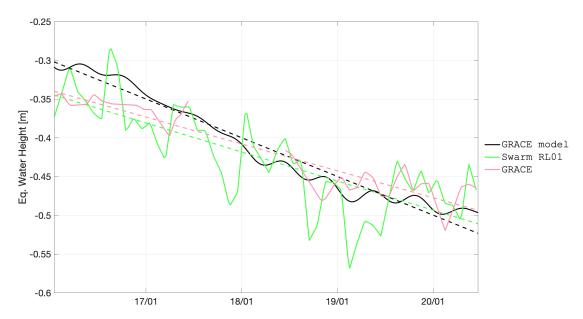

Figure 26 – Time series of EWH for the Western Antarctica region (latitude -80 to -70 degrees, longitude -140 to -85 degrees).

solution	constant	constant	linear term	linear term	corr. coeff.
Solution	term [cm]	term Δ [cm]	[cm/year]	Δ [cm/year]	[]
GRACE MODEL	-41.26	0.00	-5.00	0.00	1.00
Swarm RL01	-42.76	-1.50	-3.75	1.25	0.85
GRACE	-42.39	-1.13	-3.47	1.53	0.97

Table 19 – Statistics of the agreement between GRACE/GRACE-FO and Swarm time series relative to the GRACE/GRACE-FO climatological model for the Western Antarctica region.

5.3.18 Eastern Antarctica region

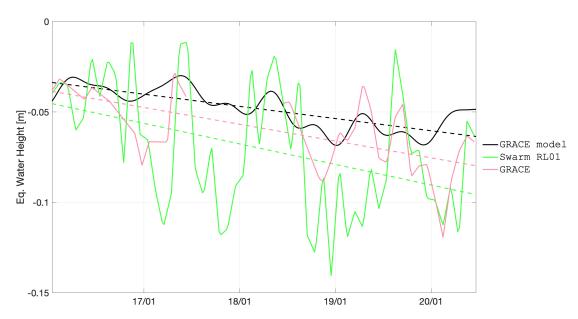

Figure 27 – Time series of EWH for the Eastern Antarctica region (latitude -80 to -68 degrees, longitude 80 to 130 degrees).

solution	constant	constant	linear term	linear term	corr. coeff.
Solution	term [cm]	term Δ [cm]	[cm/year]	Δ [cm/year]	[]
GRACE MODEL	-4.82	0.00	-0.67	0.00	1.00
Swarm RL01	-7.05	-2.23	-1.14	-0.46	0.47
GRACE	-6.11	-1.28	-0.93	-0.26	0.62

Table 20 – Statistics of the agreement between GRACE/GRACE-FO and Swarm time series relative to the GRACE/GRACE-FO climatological model for the Eastern Antarctica region.

5.3.19 Overview

solution	$\begin{array}{c} \text{constant} \\ \text{term } \Delta \text{ RMS} \\ \text{[cm]} \end{array}$	linear term Δ RMS [cm/year]	corr. coeff. mean []
GRACE model	0.00	0.00	1.00
Swarm RL01	1.68	0.88	0.74
GRACE	1.33	0.98	0.85

Table 21 – Statistics of the agreement between the GRACE and Swarm time series for the regions displayed in Sections 5.3.1 to 5.3.18.

5.4 Temporal variability

temporal STD of Swarm RL01 (2016-01 to 2020-06) 750km Gaussian smoothing

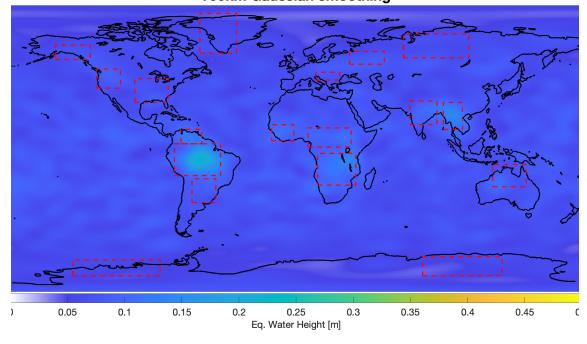

Figure 28 - Temporal variability of the Swarm combined solutions and
